

The DataRetriever class uses the DataStorage class to retrieve patient data for storage.

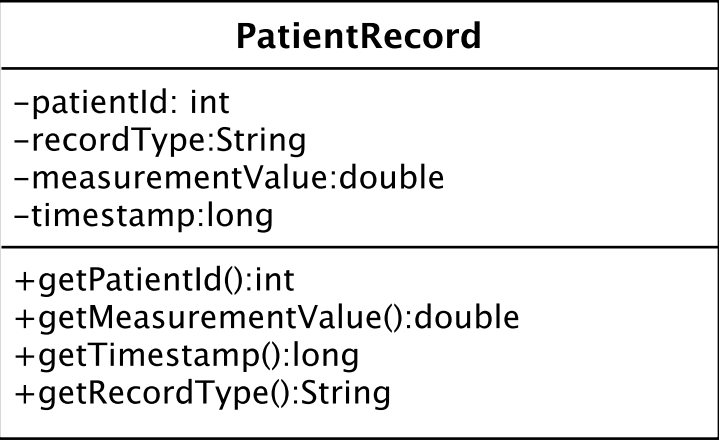

0..\*

1..\*

Every PatientRecord is a unique health measurement or record that has been linked to that specific patient over time. where there won't be patient record of there is no pataint

when new patiant data have to be add the DataRetriever class to securely retrieve data.  
Following that, this data is sent to the DataStorage class, which uses it to generate the appropriate Patient and PatientRecord objects and store them.  
The PatientRecord entries in the DataStorage are added to or updated over time as new health measurements are recorded.  
Access to patient data can be granted to authorised users via the DataStorage class, which offers ways to obtain both basic patient information and particular health records.
